

Meng-Ju Lee (Lance)

Full-stack engineer with 2 years of cross-industry experience spanning digital product design and full-stack development, currently at an online-entertainment platform; worked on million-budget SaaS, finance and government projects. Led a total-win report migration from MySQL to ClickHouse (a full-month query from ~104s to ~5s, ~21×), drove report/monitoring automation (300+ hours saved per year), and refactored a large Vue module (4221 lines, -54%). A design and project-management background lets me read requirements and user experience precisely and tie technical decisions to business goals.

Skills

<> System refactoring

Modularized shared settings: a 4221-line Vue monolith split into 10 files (main file -54%); split a tangled member-page API into 3 focused APIs, front-end main file 712 → ~190 lines.

Data viz & automation

Turned repetitive manual work into scheduled automation and visualization (v-charts line charts + draggable tables); moved daily reports/monitoring to Kernel schedules, saving 300+ hours/year.

Full-stack development

React/Vue front-end and PHP/Laravel back-end; comfortable with MVC and end-to-end delivery from DB design to UI.

DB migration & performance

MySQL/MariaDB/ClickHouse; independently led a MySQL→ClickHouse migration (MV + AggregatingMergeTree), ~21× faster queries, zero-downtime, data-consistent.

Third-party integration

LINE/Slack Bot SDK integration and cloudflared tunneling; skilled at pushing messages/data through firewalled intranets in real time.

Project management

Notion, Trello and Redmine for managing scope, progress and tasks to keep execution efficient.

Experience

● Full-Stack Engineer

2025.06 - present

Tonwa Online Entertainment Co., Ltd., Taipei

Technical Support team — full-stack development and operations for game-operations reports and back-office systems.

- Led the total-win report DB migration; a full-month query dropped from ~104s to ~5s (~21×).
- Fully automated daily manual work (bet-daily table, odds-range monitoring, cash-flow queries — 300+ hours/year).
- Refactored a 4221-line Vue monolith into 10 files (main file -54%); the new structure was reused by later features.
- Delivered a brand-new currency back office from zero in 8 weeks with a colleague (34 items shipped, 69 personal commits).

● Full-Stack Bootcamp Trainee

2024.11 - 2025.04

iSpan International (formerly ILL), Taichung

- Led a 5-person team building the HUBD fast-fashion e-commerce MVP — React front-end, Laravel back-end, API integration, MySQL.
- Built the EatNow delivery-platform prototype from 0 to 1; expanded a single-breakpoint design to all devices (+50% compatibility).

● UX Designer + Project Manager

2023.09 - 2024.09

Youshi Design Co., Ltd., Taipei

A senior UX/service-design software consultancy.

- Multi-project management and tender proposals: Chunghwa Post ATM tender (2nd place), IDDI accessibility site, Treasure Hill experience design (95% schedule accuracy).
- Interface design and user research for high-complexity platforms: a 700+-page carbon-inventory system, the Cooc education platform, the company's new website GUI.

Projects

Player Cash-Flow Report

- Background: CS / risk control needed cash-flow lookups across monthly shard tables; 20-person batches took 4–5 min.
- Work: auto-routed queries between a ClickHouse table and MySQL shards by date, via a query builder.
- Challenge: slow cross-month shard queries, batch timeouts, and CH↔MySQL results had to match exactly.
- Contribution & result: independently designed the routing and CH schema, verified against real data; 20-person batches 4–5 min → 15–20 s (~3.2× in QA).

Odds-Range Monitoring + LINE/Slack Auto-Push Bot

- Background: risk control compiled and reported odds-range + ops data by hand daily — slow and error-prone.
- Work: used LINE/Slack Bot SDK + cloudflared tunneling to push monitoring results automatically on a schedule.
- Challenge: firewalled intranet limits and a cross-host clock-skew race condition.
- Contribution & result: independently set up the tunnel, scheduling and error-handling; manual reporting → fully automated push, ~304 hours/year saved.

Bet-Daily Table Automation & Visualization

- Background: the bet-daily table took ~20 min of manual entry each day and had 6 long-standing pain points.
- Work: built an automation pipeline; visualized multi-game trends with v-charts line charts and draggable tables.
- Challenge: multi-game data integration, template management, and historical re-runs.
- Contribution & result: designed the pipeline, visualization and template-management flow; 20 min/day → 0, all 6 pain points resolved.

Q-Coin Back Office

- Background: the company introduced a brand-new virtual currency (Q-Coin); the back office was built from scratch.
- Work: backward-compatible DB schema + Vue front-end; assessed ~50 reports, shipped 34 items.
- Challenge: very fuzzy requirements, two-month deadline, dual-currency UI, 8+ concurrent branches to merge.
- Contribution & result: co-built with a colleague, 16 items solo, 69 commits; delivered from zero in 8 weeks, 34 shipped, 15+ unneeded features scoped out.

Total-Win Report DB Migration (MySQL → ClickHouse)

- Background: the total-win report queried MySQL monthly/daily shards; a full-month query took ~104 s.
- Work: migrated to ClickHouse (MV + AggregatingMergeTree), routing between CH and MySQL by date.
- Challenge: zero-downtime cutover and pre/post data-consistency verification.
- Contribution & result: independently led the migration, CH schema and partition-key design, reconciled against real data; full-month query ~104 s → ~5 s (~21×), zero downtime.

Online-Member Page Refactor & Cross-Team Requirements

- Background: the member page was a single tangled API with a 712-line front-end main file and multi-team demands.
- Work: split the single API into 3 focused APIs and refactored the front end.
- Challenge: preserve existing currency logic while integrating exec / operations / risk-control needs.
- Contribution & result: led the API split, front-end refactor and cross-team clarification; 1 tangled API → 3, front-end main file 712 → ~190 lines.

Education

- **Northern Arizona University — M.S. in Computer Information Technology** 2024.09 - 2025.09
 - English: GRE 315 / TOEFL 100 (= IELTS 7 = TOEIC 945+).
 - Under the MOEA IDDI program, independently built a WCAG-compliant accessibility site with React and Tailwind CSS.
- **Peking University — Bachelor's Degree** 2017.09 - 2022.06
 - Exchange at the University of Tokyo and Hong Kong Polytechnic University, all-A grades during the exchange.
 - First-class MOE scholarship for HK/Macao/Taiwan students three years running; 2021 top prize (top 3 university-wide).
